TASKIFY

Software Requirements SPECIFICATION

TASK MANAGEMENT APP

DOCUMENTATION PURPOSE :

This document describes the requirements, features, users, and system behaviour of the Taskify System.

It explains how users can manage tasks, track progress, and organize their daily activities.

It provides a clear understanding of the system functions and requirements.

DOCUMENTATION ATTRIBUTES	VALUES
Document Type	Software Requirements Specification
Version	1.0

Project Name	TASKIFY
Doc ID	TASKIFY-SRH-001
Prepared for	TASKIFY project team
Technology Baseline	Web application
Classification	Internal use
Date	12.10.26
Status	Draft

1. Introduction

Taskify is a web application for managing and organizing tasks efficiently.

Users can create, view, update, and track their tasks.

The system helps users complete their activities in an organized manner.

2. Business Context and Objectives

The system provides an organized way to manage daily tasks and activities.

It reduces manual task tracking and improves productivity.

The main objective is to help users manage tasks efficiently and monitor their progress.

3. Stakeholders and System Context

The main stakeholders are Users and Administrators.

Users can create and manage their tasks according to their requirements.

Administrators manage users, tasks, and overall system activities.

4. Product Overview and System Context

The system manages tasks, users, task status, and task information.

Users can create tasks, set priorities, and track their progress.

The system provides an easy interface for managing daily activities.

5. Assumptions, Constraints and Dependencies

Users require internet access to use the web application.

The system depends on a database for storing user and task information.

Users must have valid login credentials to access protected features.

6. Functional Requirements

The system provides functions such as registration and login.

Users can create, edit, delete, search, and view tasks.

Administrators can manage users and monitor task-related information.

7. Business Rules

Every task must contain the required task information.

Users can update the status of their tasks based on their progress.

Only authorized users can modify or delete their tasks.

8. Use Case Specifications

The main use cases include Login, Create Task, View Task, Update Task, and Delete Task.

Users perform these activities to manage their tasks.

Administrators have use cases for managing users and monitoring system activities.

9. Data Requirements

The system stores user, task, priority, status, and task-related information.

Important user and task data must be maintained securely.

The stored data is used to support task management and progress tracking.

10. External Interface Requirements

The system provides a web-based user interface for users and administrators.

It connects with the database to store and retrieve task information.

The interface should be simple, clear, and easy to use.

11. Non-Functional Requirements

The system should be secure, reliable, responsive, and scalable.

It should provide good performance while handling user requests.

The system should offer a simple and convenient task management experience.

12. Security and Access Control

Users and administrators must authenticate before accessing protected system functions.

Access is controlled according to the user's role.

This helps protect user information and task data.

13. Error Handling and Validation

The system validates user details and task information.

Invalid or incomplete information should be identified before processing an operation.

Errors such as invalid login or incomplete task details should be displayed clearly.

14. Acceptance and Release Criteria

The system is accepted when users can successfully log in and manage their tasks.

Users must be able to create, update, view, and delete tasks successfully.

All major task management functions must pass the required testing before release.

15. Requirements Traceability Matrix

Each requirement is mapped to its corresponding design, implementation, and testing activities.

This helps ensure that every requirement is properly implemented.

It also provides complete coverage from requirements through testing.

16. Out of Scope / Future Considerations

Advanced AI-based task recommendations can be considered in the future.

Calendar integration, reminders, and team collaboration features can also be added later.

A dedicated mobile application can be developed as a future enhancement.
